PAY-PER-USE In regards to quick, hurried, small deployments, “pay-per-use” public cloud providers, like AWS, are usually the safest bet especially if buyers are unconcerned with security, reliability and availability and instead need a fast, inexpensive solution. But for larger, enterprise-level deployments, requiring continuous monitoring, dedicated support, and guaranteed security then buyers need to consider and evaluate partnering with a veteran enterprise private cloud provider, like Unitas Global, to deliver a private, secure, and reliable cloud environment.
